

## Highly Versatile Buck-Boost Ambient Energy Manager Battery Charger For AC/DC Sources

### Feature

#### Ultra-low power start-up

- Cold start from 275 mV input voltage and 3  $\mu$ W input power (typical).

#### Very efficient energy extraction

- Open-circuit voltage sensing for Maximum Power Point Tracking (MPPT).
- Selectable open-circuit voltage ratios from 35% to 80% or fixed impedance.
- Programmable MPPT sensing period.
- MPPT voltage operation range from 100 mV to 4.5 V.

#### Adaptive and smart energy management

- DCDC switches automatically between boost, buck-boost and buck operation, according to input and output voltages, to maximize energy transfer.

#### Battery protection features

- Selectable over-charge and over-discharge protection for any type of rechargeable battery or (super-)capacitor.
- Fast super-capacitor charging.
- Dual cell super-capacitor balancing circuit.

#### Smallest footprint, smallest BOM

- Only three external components are required.
- One 10  $\mu$ H inductor.
- Two capacitors: one 10  $\mu$ F and one 22  $\mu$ F.

### Description

The AEM30300 is an integrated energy management circuit that extracts DC power from an ambient energy harvesting source to store energy in a storage element. The AEM30300 allows to extend battery lifetime and ultimately eliminates the primary energy storage element in a large range of applications.

Thanks to its Maximum Power Point Tracking system, the AEM30300 extracts the maximum energy available from the source. It integrates an ultra-low power DCDC converter which operates with input voltages ranging from 100 mV to 4.5 V.

With its unique cold start circuit, the AEM30300 can start harvesting with an input voltage as low as 275 mV and from an input power of 3  $\mu$ W. The preset protection levels determine the storage element voltages protection thresholds to avoid over-charging and over-discharging the storage element and thus avoiding damaging it. Those are set through configuration pins. Moreover, custom threshold voltages can be obtained at the expense of a few configuration resistors.

The chip integrates all active elements for powering a typical wireless sensor. Only two capacitors and one inductor are required.

### Applications

Asset Tracking/Monitoring	Industrial applications
Retail ESL/Smart sensors	Aftermarket automotive
Smart home/Building	

### Device Information

## 1. Introduction

Figure 1: Simplified Schematic View

The AEM30300 is a full-featured energy efficient power management circuit able to harvest energy from an energy source (connected to **SRC**) to charge a storage element (connected to **STO**). This is done with a minimal bill of material: only 2 capacitors and one inductor are needed for a basic setup.

The heart of the AEM30300 is a regulated switching DCDC converter with high power conversion efficiency.

At first start-up, as soon as a required cold-start voltage of 275 mV and a sparse amount of power of at least 3  $\mu$ W is available at the source, the AEM30300 coldstarts. After the cold start, the AEM extracts the power available from the source if the working input voltage is at least 100 mV.

Through four configuration pins (**STO\_CFG[3:0]**), the user can select a specific operating mode out of 15 modes that cover most application requirements without any dedicated external component. Those operating modes define the protection levels of the storage element. If none of those 15 modes fit the user's storage element, a custom mode is also available to allow the user to define a mode with custom specifications.

Status pin **ST\_STO** provides information about the voltage levels of the storage element. **ST\_STO** is HIGH when the voltage of the storage element  $V_{STO}$  is above  $V_{CHRDY}$  and is reset when the voltage drops below  $V_{OVDIS}$ .

The Maximum Power Point (MPP) ratio is configurable thanks to three configuration pins (**R\_MPP[2:0]**) and ensures an optimum biasing of the harvester to maximize power extraction. Depending on the harvester, it is possible to adapt the timings of the MPP evaluations with the two configuration pins (**T\_MPP[1:0]**) that sets the periodicity and the duration of the MPP evaluation.

The AEM30300's DCDC converter can work in two modes: **LOW POWER MODE** and **HIGH POWER MODE**, each one of these being optimized for a power range on **SRC**.

The charging of the storage element can be prevented by pulling **EN\_STO\_CH** to **GND**, typically to protect the storage element if the temperature is too low/high to safely charge it.

## 2. Pin Configuration and Functions

Figure 2: Pinout Diagram QFN 28-pin

NAME	PIN NUMBER	FUNCTION	
<b>Power Pins</b>			
CS_IN	28	Input for the eternal cold start circuit.	
ZMPP	1	Used for the configuration of the ZMPP (optional). Must be left floating if not used.	
SRC	2	Connection to the harvested energy source.	
BUFSRC	4	Connection to an external capacitor buffering the DCDC converter input.	
LIN	5	DCDC inductance connection.	
LOUT	6	DCDC inductance connection.	
VINT	10	Internal voltage supply.	
BAL	13	Connection to mid-point of a dual-cell supercapacitor (optional). Must be connected to GND if not used.	
STO	14	Connection to the energy storage element - battery or (super-)capacitor. Cannot be left floating. Must be connected to a minimum capacitance of 100 $\mu$ F or to a rechargeable battery.	
<b>Status Pins</b>			
ST_STO	26	Logic Output	HIGH: HIGH when the storage device voltage $V_{STO}$ rises above $V_{CHRDY}$ threshold. LOW: LOW when $V_{STO}$ drops below the $V_{OVDIS}$ threshold.

Table 1: Power and Status Pins

NAME	PIN NUMBER	HIGH LEVEL	FLOATING STATE	FUNCTION
<b>Configuration Pins</b>				
R_MPP[0]	11	V <sub>VINT</sub>	HIGH	Used for the configuration of the MPP ratio. Read as HIGH when left floating.
R_MPP[1]	9			
R_MPP[2]	8			
T_MPP[0]	20	V <sub>VINT</sub>	HIGH	Used for the configuration of the MPP timings. Read as HIGH when left floating.
T_MPP[1]	22			
STO_CFG[0]	23	V <sub>VINT</sub>	HIGH	Used for the configuration of the threshold voltages for the energy storage element V <sub>OVDIS</sub> , V <sub>CHRDY</sub> and V <sub>OVCH</sub> . Read as HIGH when left floating.
STO_CFG[1]	24			
STO_CFG[2]	25			
STO_CFG[3]	18			
STO_OVCH	17	Used for the configuration of the threshold voltages (V <sub>OVDIS</sub> , V <sub>CHRDY</sub> and V <sub>OVCH</sub> ) for the energy storage element when STO_CFG[3:0] are set to custom mode (optional). Must be left floating if not used.		
STO_RDY	16			
STO_OVDIS	15			
EN_STO_FT	21	V <sub>VINT</sub>	HIGH	<ul style="list-style-type: none"> <li>- Pulled up to V<sub>VINT</sub> or floating: allows charges flowing directly from SRC to STO when SRC is above 5V.</li> <li>- Pulled down to GND: normal operation.</li> </ul>
EN_STO_CH	12	V <sub>LOAD</sub>	HIGH	<ul style="list-style-type: none"> <li>- Pulled up to LOAD or floating: enables the charging of the battery</li> <li>- Pulled down to GND: disables the charging of the battery</li> </ul>
EN_HP	19	V <sub>VINT</sub>	HIGH	<ul style="list-style-type: none"> <li>- Pulled up to V<sub>VINT</sub> or floating: HIGH POWER MODE enabled</li> <li>- Pulled down to GND: HIGH POWER MODE disabled</li> </ul>
<b>Other</b>				
GND	3, 7, 27	Ground connection, best possible connection to PCB ground plane.		
	Exposed pad			

Table 2: Configuration and Ground Pins

### 3. Absolute Maximum Ratings

Parameter	Value
Voltage on <i>STO, SRC, BUFSRC, LIN, LOUT, ZMPP, BAL, CS_IN</i>	-0.3 V to 5.5 V
Voltage on <i>VINT, T_MPP[1:0], R_MPP[2:0], STO_CFG[3:0], STO_OVCH, STO_OVDIS, STO_RDY, EN_HP, EN_STO_CH</i>	-0.3 V to 2.75 V
Operating junction temperature	-40 °C to 125 °C
Storage temperature	-65 °C to 150 °C
ESD HBM voltage	> 2000 V
ESD CDM voltage	> 500 V

EN_HP	Configuration pin for the controller	GND		VINT	

Table 6: Recommended Operation Conditions

1. Consider all component tolerance and deratings. Typically, DC-bias derating has a major impact on capacitance on ceramic capacitors.

## 7. Functional Block Diagram

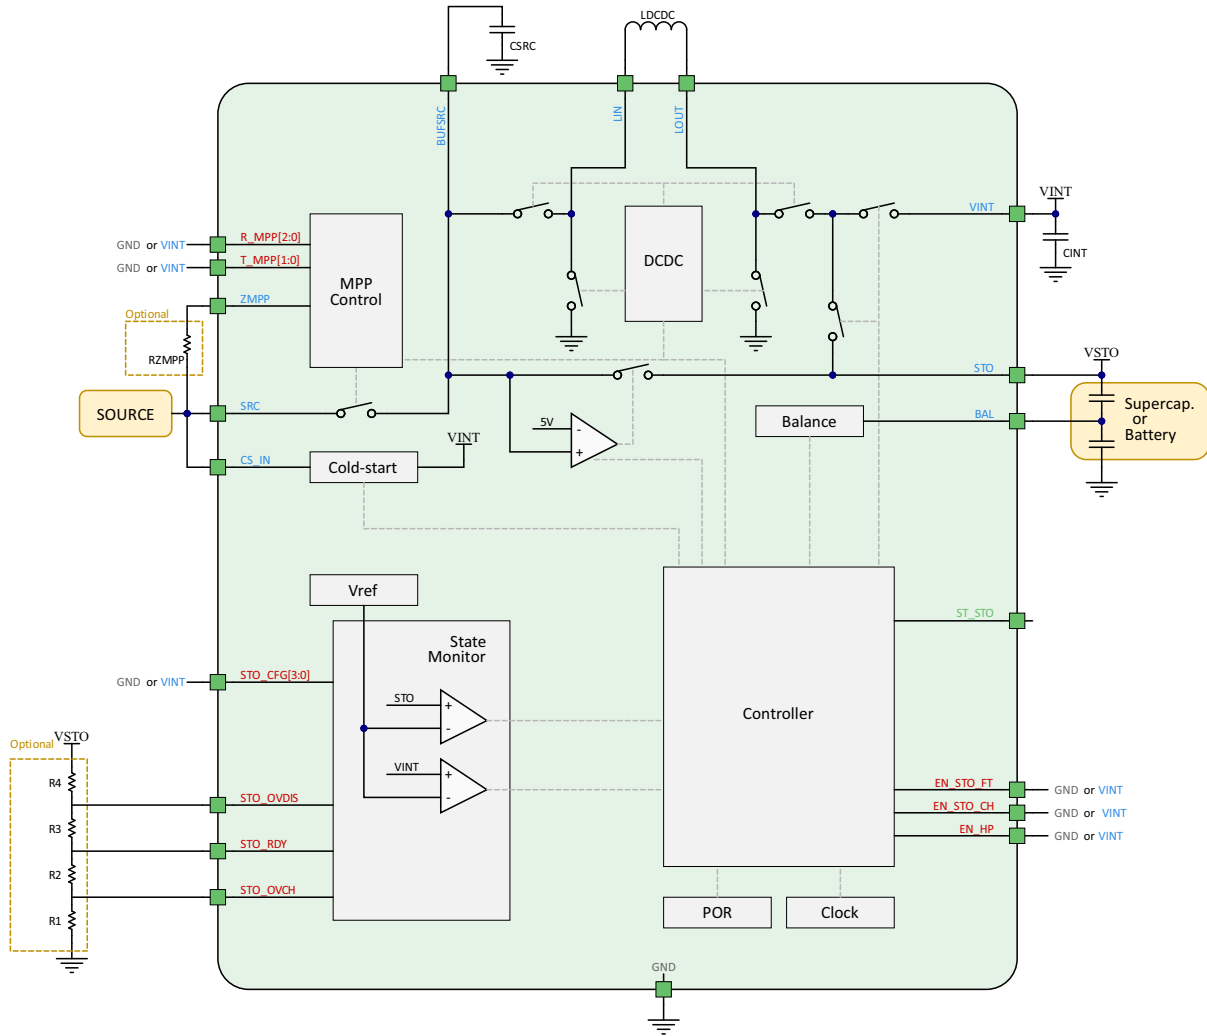

Figure 3: Functional Block Diagram

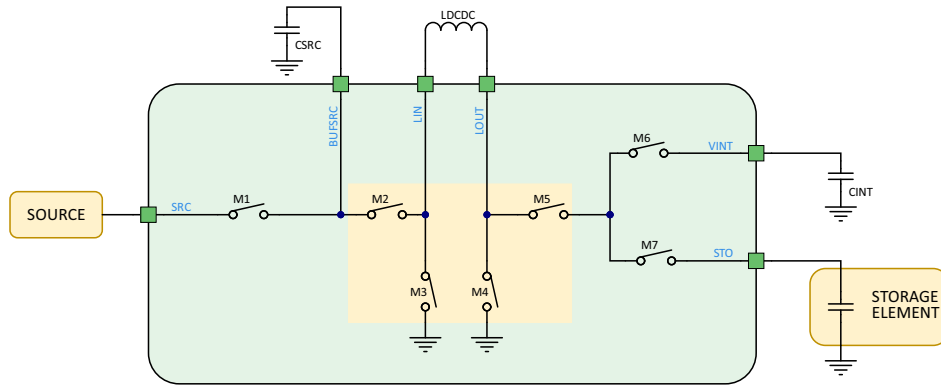

Figure 4: Simplified Schematic View of the AEM30300

## 8. Theory of Operation

### 8.1. DCDC Converter

The DCDC converter converts the voltage available at **BUFSRC** to a level suitable for charging the storage element **STO** or to regulate the internal supply **VINT**. The switching transistors of the DCDC converter are M2, M3, M4 and M5. Thanks to M6 and M7, the controller selects between **VINT** and **STO** respectively as the converter output. **STO** is selected as an output only when **VINT** does not need to be supplied.

The reactive power component of this converter is the external inductor  $L_{DCDC}$ . Periodically, the MPP control circuit disconnects the source from the **BUFSRC** pin with the transistor M1 in order to let the harvester on **SRC** rise to its open-circuit voltage  $V_{OC}$  and measure it. This is done to define the optimal voltage level  $V_{MPP}$ , which is determined by applying the MPP ratio on  $V_{OC}$ . **BUFSRC** is decoupled by the capacitor  $C_{SRC}$ , which smooths the voltage against the current pulses pulled by the DCDC converter. The storage element is connected to the **STO** pin.

Depending on its input voltage and its output voltage, the DCDC converter will work as a boost converter, a buck converter or a buck-boost converter. The maximum power that can be harvested and supplied to the output depends on the power mode (**HIGH POWER MODE** or **LOW POWER MODE**), which is configured through the **EN\_HP** pin (see Section 9.1).

DCDC Converter Mode	Input Voltage / Output Voltage
Boost	$V_{IN} < V_{OUT} - 250 \text{ mV}$
Buck	$V_{IN} > V_{OUT} + 250 \text{ mV}$
Buck - Boost	$V_{OUT} - 250 \text{ mV} < V_{IN} < V_{OUT} + 250 \text{ mV}$

Table 7: DCDC Converter Modes

### 8.2. Cold-Start Circuit

The AEM30300 is able to coldstart if the voltage on **CS\_IN** is above 0.275 V. The minimum available power is:

- 3  $\mu\text{W}$  if  $V_{STO}$  is above  $V_{CHRDY}$ .
- 6  $\mu\text{W}$  if  $V_{STO}$  is below  $V_{CHRDY}$ .

**CS\_IN** is typically connected to **SRC** to allow the AEM30300 to coldstart from the energy available on the harvester. Nevertheless, any other energy source can be connected to **CS\_IN** as long as it meets the electrical specifications constraints described in Sections 5 and 6.

### 8.3. AEM30300 States Description

Figure 5: Diagram of the AEM30300 States

#### 8.3.1. Reset and Wake Up States

The **RESET STATE** is a state where all nodes are deeply discharged and there is no available energy to be harvested. As soon as the required cold start voltage of 275 mV and a sparse amount of power of just 3  $\mu\text{W}$  become available on **CS\_IN** (usually connected to **SRC**), the AEM30300 switches to **WAKE-UP STATE**, and energy is extracted from **SRC** to make  $V_{\text{VINT}}$  rise to 2.2 V. When  $V_{\text{VINT}}$  reaches those 2.2 V, the AEM30300 switches to **SUPPLY STATE**.

#### 8.3.2. Supply State

In **SUPPLY STATE**, three scenarios are possible:

- There is enough power provided by the source (**SRC**) to keep  $V_{\text{VINT}}$  at 2.2 V. The excessive power is used to charge the storage element on **STO**. In that case, the circuit remains in **SUPPLY STATE**. If **STO** is fully charged, the DCDC converter is disabled to prevent over-charging the storage element, and the **SRC** pin is set to high impedance.
- Due to a lack of power from the source,  $V_{\text{STO}}$  falls below  $V_{\text{OVDIS}}$ . In this case, the circuit enters **RESET STATE** as explained in Section 8.3.1.
- There is no power on **SRC**. It is therefore not possible to maintain  $V_{\text{VINT}}$  to 2.2 V. In this case, the circuit enters in **RESET STATE**.

The AEM30300 internal circuit current consumption causes  $C_{\text{INT}}$  to discharge. When the voltage on **VINT** falls below its 2.2 V regulation set point, the DCDC converter switches its output to recharge  $C_{\text{INT}}$  from **SRC**, thus keeping **VINT** regulated. If no sufficient power is available on **SRC** to keep **VINT** regulated, the AEM30300 switches to **RESET STATE**.

### 8.4. Maximum Power Point Tracking

During **SUPPLY STATE**, the voltage on **SRC** is regulated by an internal Maximum Power Point Tracking (MPPT) module. The MPPT module evaluates  $V_{\text{MPP}}$ , the voltage at which the source provides the highest possible power, as a given fraction of the open-circuit voltage of the source  $V_{\text{OC}}$ . This ratio is set by the **R\_MPP[2:0]** terminals according to Table 9. The sampling period and duration are set according to Table 10 by the **T\_MPP[1:0]** terminals. The AEM30300 supports any  $V_{\text{MPP}}$  levels in the range from 100 mV to 4.5 V. It offers a choice of seven values for the  $V_{\text{MPP}} / V_{\text{OC}}$  fraction. It can also match the input impedance of the DCDC converter with an impedance connected to the **ZMPP** terminal as explained in section 9.6.

### 8.5. Balancing for Dual-Cell Supercapacitor

The balancing circuit allows the user to balance the internal voltage of the dual-cell supercapacitor connected to **STO** in order to avoid damaging the supercapacitor because of excessive voltage on one cell.

If **BAL** is connected to **GND**, the balancing circuit is disabled. This configuration must be used if a battery, a capacitor or a single-cell supercapacitor is connected on **STO**.

If **BAL** is connected to the node between both cells of a supercapacitor, the balancing circuit compensates for any mismatch of the two cells that could lead to the over-charge of one of two cells. The balancing circuit ensures that **BAL** remains close to  $V_{\text{STO}} / 2$ . This configuration must be used if a dual-cell supercapacitor is connected to **STO**, and that this supercapacitor requires cells balancing.

The balancing circuit works as follows, with  $V_{\text{BAL}}$  the voltage on the **BAL** pin:

- $V_{\text{BAL}} > \frac{V_{\text{STO}}}{2}$ : the AEM30300 enables a switch between **BAL** and **GND** to discharge the bottom supercapacitor cell to **GND** (up to 20 mA).
- $V_{\text{BAL}} < \frac{V_{\text{STO}}}{2}$ : the AEM30300 enables a switch between **STO** and **BAL** to discharge the top supercapacitor cell to the bottom supercapacitor cell (up to 20 mA).

*NOTE: the balancing feature is optimized for supercapacitors, for use with other storage elements (batteries, etc.), please contact e-peas support.*

## 9. System Configuration

### 9.1. High Power / Low Power Mode

When **EN\_HP** is pulled to **VINT**, the DCDC converter is configured to **HIGH POWER MODE**. This allows higher currents to be extracted from the DCDC converter input (**SRC**) to the DCDC converter output (**STO**).

### 9.2. Storage Element Configuration

Through four configuration pins (**STO\_CFG[3:0]**), the user can set a particular operating mode from a range that covers most application requirements, without any dedicated external component as shown in Table 8. The three threshold levels are defined as:

- $V_{OVCH}$ : maximum voltage accepted on the storage element before disabling its charging.
- $V_{CHRDY}$ : minimum voltage required on the storage element before **ST\_STO** is HIGH.
- $V_{OVDIS}$ : minimum voltage accepted on the storage element before setting **ST\_STO** LOW.

Configuration pins				Storage element threshold voltages			Typical use
<b>STO_CFG[3:0]</b>				$V_{OVDIS}$	$V_{CHRDY}$	$V_{OVCH}$	
L	L	L	L	3.00 V	3.50 V	4.05 V	LiCoO <sub>2</sub> battery, Li-Po battery, Lithium Titanate (3.8 V) battery (long life).
L	L	L	H	2.80 V	3.10 V	3.60 V	LiFePO <sub>4</sub> battery, Lithium capacitor (LiC).
L	L	H	L	1.85 V	2.40 V	2.70 V	Dual-cell NiMH battery, Lithium-Titanate (2.4V) battery.
L	L	H	H	0.20 V	1.00 V	4.65 V	Dual-cell supercapacitor.
L	H	L	L	0.20 V	1.00 V	2.60 V	Single-cell supercapacitor.
L	H	L	H	1.00 V	1.20 V	2.95 V	Single-cell supercapacitor.
L	H	H	L	1.85 V	2.30 V	2.60 V	Lithium-Titanate battery (2.4V).
L	H	H	H	Custom Mode (single-cell NiMH battery, LiC, etc.) <sup>1</sup> .			
H	L	L	L	1.10 V	1.25 V	1.50 V	Ni-Cd single-cell battery.
H	L	L	H	2.20 V	2.50 V	3.00 V	Ni-Cd dual-cell battery.
H	L	H	L	1.45 V	2.00 V	4.65 V	Dual-cell supercapacitor.
H	L	H	H	1.00 V	1.20 V	2.60 V	Single-cell supercapacitor.
H	H	L	L	2.00 V	2.30 V	2.60 V	Solid State battery.
H	H	L	H	3.00 V	3.50 V	4.35 V	LiCoO <sub>2</sub> battery, Li-Po battery, Lithium Titanate (3.8 V) battery.
H	H	H	L	2.60 V	2.70 V	4.00 V	Tadiran TLI.
H	H	H	H	2.60 V	3.50 V	3.90 V	Tadiran HLC.

Table 8: Storage Element Configuration Pins

1. An example of a single-cell NiMH batteries optimized custom mode setting can be found at Section 10.2.

### 9.3. Custom Mode Configuration

Figure 6: Custom Mode Settings

When `STO_CFG[3:0] = LHHH`, the custom mode is selected and all four configuration resistors must be wired as shown in Figure 6.

$V_{OVCH}$ ,  $V_{CHRDY}$  and  $V_{OVDIS}$  are defined thanks to R1, R2, R3 and R4, which can be determined within the following constraints:

- $R_T = R_1 + R_2 + R_3 + R_4$
- $1\text{M}\Omega \leq R_T \leq 100\text{M}\Omega$
- $R_1 = R_T \cdot \frac{1\text{V}}{V_{OVCH}}$

- $R_2 = R_T \cdot \left( \frac{1\text{V}}{V_{CHRDY}} - \frac{1\text{V}}{V_{OVCH}} \right)$
- $R_3 = R_T \cdot \left( \frac{1\text{V}}{V_{OVDIS}} - \frac{1\text{V}}{V_{CHRDY}} \right)$
- $R_4 = R_T \cdot \left( 1 - \frac{1\text{V}}{V_{OVDIS}} \right)$

The resistors should have high values to make the additional power consumption negligible. Moreover, the following constraints must be respected to ensure the functionality of the chip:

- $V_{CHRDY} + 0.05\text{V} \leq V_{OVCH} \leq 4.5\text{V}$
- $V_{OVDIS} + 0.05\text{V} \leq V_{CHRDY} \leq V_{OVCH} - 0.05\text{V}$
- $1\text{V} \leq V_{OVDIS}$

### 9.4. Disable Storage Element Charging

Pulling down `EN_STO_CH` pin to GND disables the charging of the storage element connected to `STO`. This can be done for example to protect the storage element when the system detects that the environment temperature is too low or too high to safely charge the storage element.

While `EN_STO_CH` is pulled down, `VINT` can still be supplied from `SRC`.

To enable charging the storage element on `STO`, `EN_STO_CH` must be pulled up to `VINT` or left floating (pin is pulled up internally).

## 9.5. MPPT Configuration

The MPPT module is configured through the following pins:

- **R\_MPP[2:0]** allows for configuring the  $V_{MPP} / V_{OC}$  tracking ratio, that has to be chosen according to the characteristics of the source. Please note that if the selected mode is **ZMPP**, an external resistor must be added to the circuit as explained in Section 9.6.
- **T\_MPP[1:0]** allows for configuring the duration of an MPP evaluation and the time between two MPP evaluations.

Configuration pins			MPPT ratio
<b>R_MPP[2:0]</b>			$V_{MPP} / V_{OC}$
L	L	L	35%
L	L	H	50%
L	H	L	60%

Table 10: MPP Timing Configuration Pins

## 9.6. ZMPP Configuration

Instead of working at a ratio of the open-circuit voltage, the AEM30300 can regulate the input impedance of the DCDC converter so that it matches a constant impedance  $R_{ZMPP}$  connected to the **ZMPP** pin. In this case, the AEM30300 regulates  $V_{SRC}$  at a voltage that is the product of the **ZMPP** resistance  $R_{ZMPP}$  and the current available at the **SRC** input.

$$- 10 \Omega \leq R_{ZMPP} \leq 100 \text{ K}\Omega$$

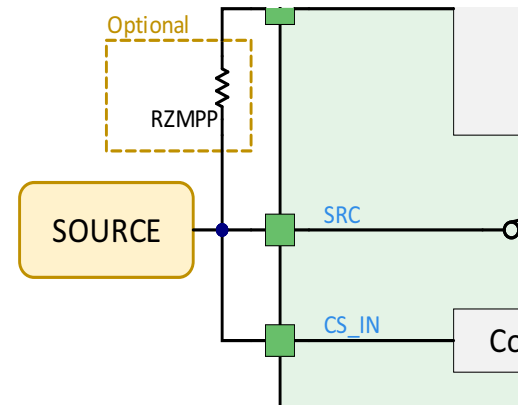

Figure 7:  $R_{ZMPP}$  Connection to the AEM30300

## 9.7. Source to Storage Element Feed-Through

When the harvester connected to **SRC** delivers a high amount of power, the AEM might not be able to pull enough current to regulate  $V_{SRC}$  to the MPP voltage. The voltage on **SRC** thus increases, eventually above 5V. To maximize the energy extracted in that case, the AEM30330 can be configured to create a direct feed-through current path from **SRC** to **STO** when  $V_{SRC}$  is above 5V. This is measured when the AEM is pulling current from the source (not during an MPP evaluation).

If the MPPT module detects that  $V_{SRC}$  is higher than 4 V and **EN\_STO\_FT** is set, the **SRC** is monitored. From that moment, if the AEM30300 detects that  $V_{SRC}$  rises above 5 V and if the storage element is not fully charged, the switch between the **SRC** and **STO** pins is closed until  $V_{SRC}$  drops below 5 V or until the storage element is fully charged.

This feature is enabled by pulling up **EN\_STO\_FT** pin to **VINT**. However, it is disabled if the storage element is fully charged, or when a MPP evaluation is occurring. Therefore the circuit must still be protected from any overshoot voltage on **SRC** above 5.5 V, for instance by a zener diode.

## 9.8. External Components

Refer to Figure 15 to have an illustration of the external components wiring.

### 9.8.1. Storage Element Information

The energy storage element of the AEM30300 can be a rechargeable battery, a supercapacitor or a capacitor. The size of the storage element must be determined so that its voltage does not fall below  $V_{OVDIS}$  even during current peaks pulled by the application. If the internal resistance of the storage element cannot sustain this voltage limit, it is advisable to decouple the battery with a capacitor.

If the application expects a disconnection of the battery (e.g. because of a user removable connector), the PCB should include a capacitor  $C_{STO}$  of at least 100  $\mu\text{F}$  connected between **STO** and **GND**. The leakage current of the storage element should be small as leakage currents directly impact the quiescent current of the whole subsystem.

### 9.8.2. External Inductor Information

The AEM30300 operates with one standard miniature inductor.  $L_{DCDC}$  must sustain a peak current of at least 1 A and a switching frequency of at least 10 MHz. Low equivalent series resistance (ESR) favors the power conversion efficiency of the DCDC converter. The recommended value is 10  $\mu\text{H}$ .

### 9.8.3. External Capacitors Information

#### 9.8.3.1. $C_{SRC}$

This capacitor acts as an energy buffer at the input of the DCDC converter. It prevents large voltage fluctuations when the DCDC converter is switching. The recommended nominal value is 22  $\mu\text{F}$ .

#### 9.8.3.2. $C_{INT}$

This capacitor acts as an energy buffer for the internal voltage supply. The recommended nominal value is 10  $\mu\text{F}$ .

## 10. Typical Application Circuits

### 10.1. Example Circuit 1

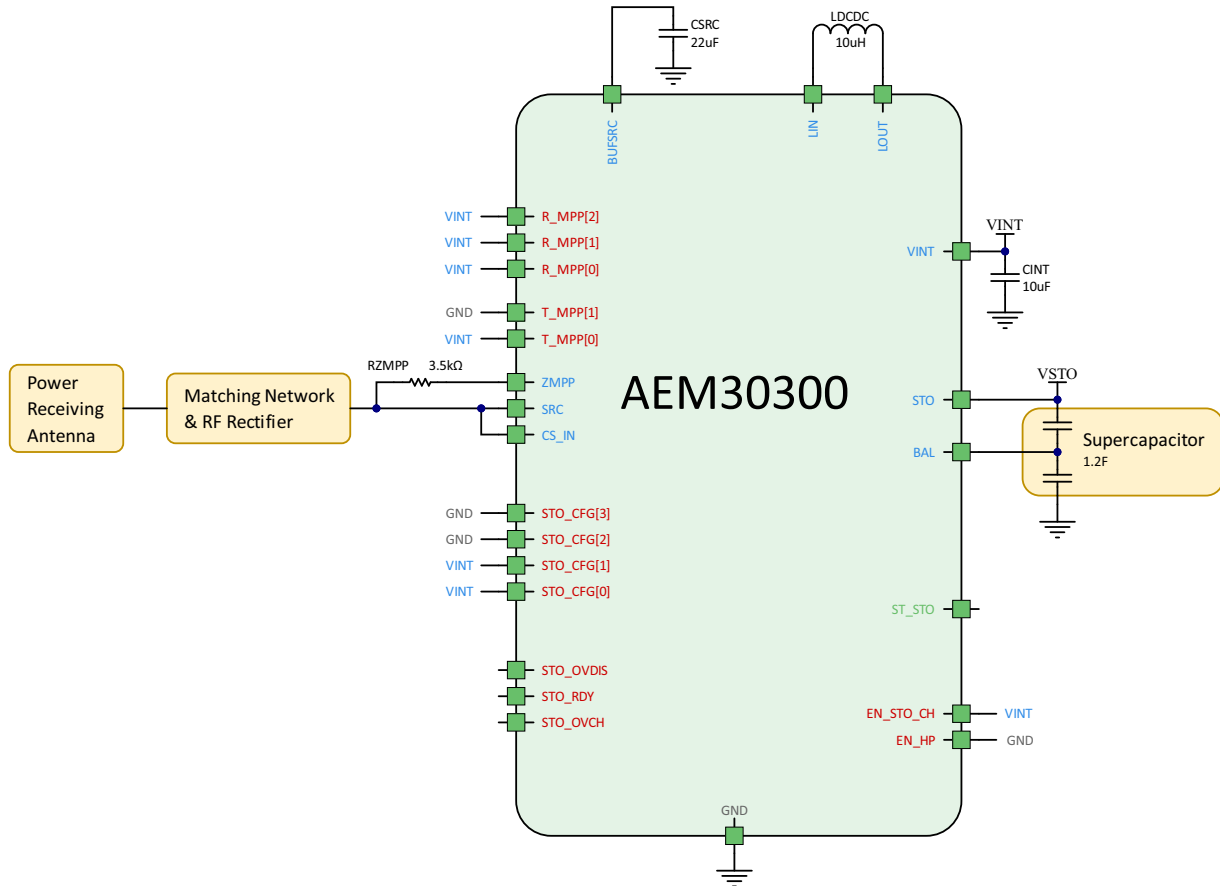

Figure 8: Typical Application Circuit 1

The circuit is an example of a system with Radio Frequency (RF) energy harvesting. It uses a pre-defined operating mode that uses standard components, and a supercapacitor as energy storage.

- Energy source: RF source.
- $R\_MPP[2:0]$  = HHH: the MPP tracker system is set to ZMPP, so that the AEM30300 will regulate SRC input resistance to  $R_{ZMPP} = 3.5 \text{ k}\Omega$  (see Section 9.6).
- $T\_MPP[1:0]$  = LH: the MPP sampling period is 280 ms and the MPP sampling duration is 5.19 ms.
- $STO\_CFG[3:0]$  = LLHH: the storage element is a dual-cell supercapacitor, with:
  - $V_{OVCH} = 4.65 \text{ V}$
  - $V_{CHRDY} = 1.00 \text{ V}$
  - $V_{OVDIS} = 0.20 \text{ V}$
- The balancing pin of the dual-cell supercapacitor is connected to BAL.
- EN\_STO\_CH is connected to VINT: the charging of the storage element on STO is enabled.
- EN\_HP is connected to GND: the DCDC converter is in LOW POWER MODE.
- EN\_STO\_FT is connected to VINT: SRC to STO feed-through is enabled when  $V_{SRC}$  is above 5 V.

## 10.2. Example Circuit 2

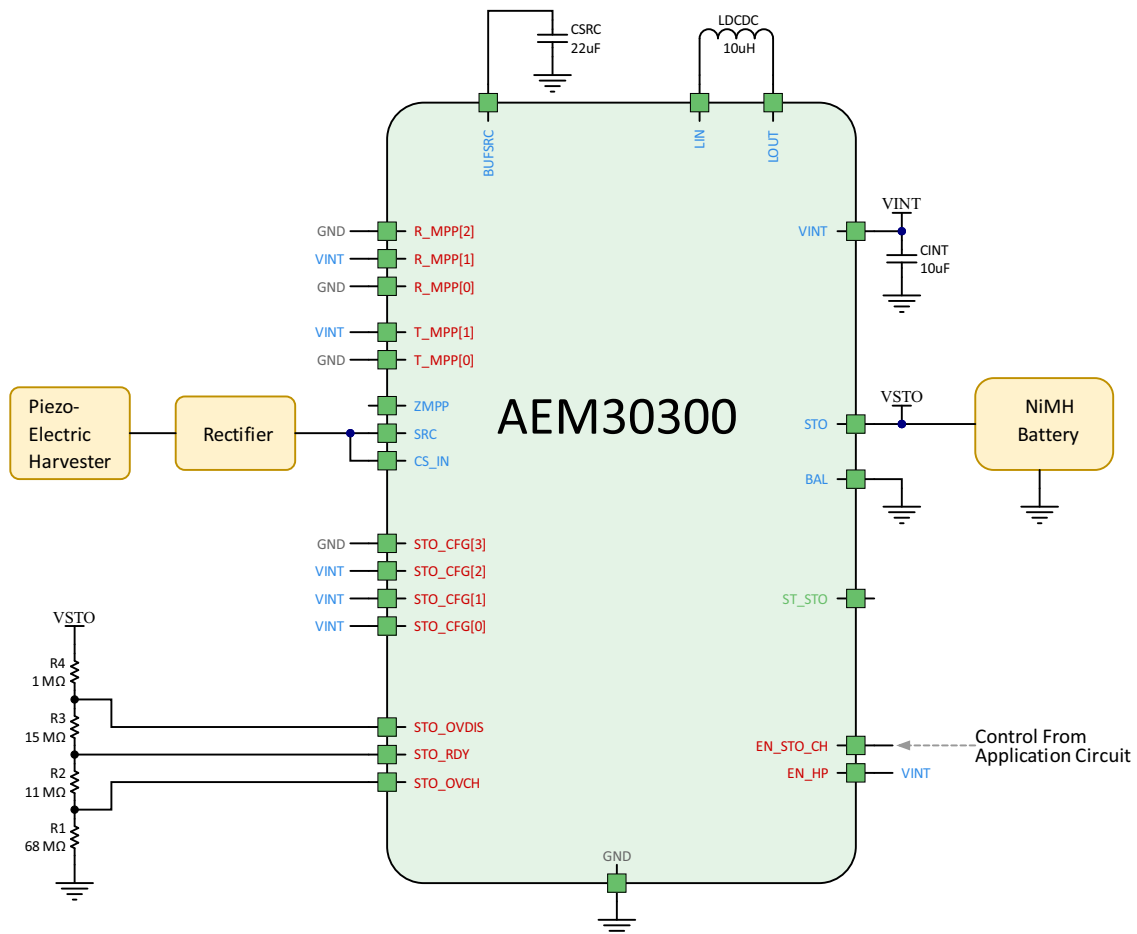

Figure 9: Typical Application Circuit 2

The circuit is an example of a system with vibration energy harvesting. It uses a rechargeable NiMH battery as storage element. The voltage thresholds are set by the custom mode.

- Energy source: piezoelectric vibration harvester.
- $R\_MPP[2:0]$  = LHL: the MPP ratio is set to 60%.
- $T\_MPP[1:0]$  = HL: the MPP sampling period is 1.12 s and the MPP sampling duration is 71.6 ms.
- $STO\_CFG[3:0]$  = LHHH: the storage element is a NiMH rechargeable battery, used with custom mode:
  - $V_{OVDIS} = 1.00\text{ V}$
  - $V_{CHRDY} = 1.20\text{ V}$
  - $V_{OVCH} = 1.40\text{ V}$
- Custom mode resistor divider calculations (values have been chosen to match E24 series value):
  - $R_T = 95\text{ M}\Omega$
  - $R_1 = R_T \cdot \frac{1\text{V}}{V_{OVCH}} \approx 68\text{ M}\Omega$
- $R_2 = R_T \cdot \left( \frac{1\text{V}}{V_{CHRDY}} - \frac{1\text{V}}{V_{OVCH}} \right) \approx 11\text{ M}\Omega$
- $R_3 = R_T \cdot \left( \frac{1\text{V}}{V_{OVDIS}} - \frac{1\text{V}}{V_{CHRDY}} \right) \approx 15\text{ M}\Omega$
- $R_4 = R_T \cdot \left( 1 - \frac{1\text{V}}{V_{OVDIS}} \right) \approx 1\text{ M}\Omega$
- BAL is not used (not a dual-cell storage element) so it is connected to GND.
- EN\_STO\_CH: the charging of the storage element present on STO is controlled by the application circuit, typically by a micro-controller GPIO output.
- EN\_HP is connected to VINT: the DCDC converter is in HIGH POWER MODE.
- EN\_STO\_FT is connected to VINT: SRC to STO feed-through is enabled when  $V_{SRC}$  is above 5 V.

*NOTE: for LIC (Lithium-ion Capacitor) storage elements, or others that would not be covered by `STO_CFG[3:0]` presets, please apply the same equations as in the above example to determine custom mode resistors values. E24 series values for typical storage elements can be found in the AEM30300 Configuration Tool spreadsheet, to be downloaded on e-peas website.*

## 11. Circuit Behavior

### 11.1. Wake-up state and Supply state

Figure 10: Wake-up state and Supply state

- **STO\_CFG[3:0]** = LLLL
- **V<sub>OVDIS</sub>** = 3.00 V
- **V<sub>CHRDY</sub>** = 3.50 V
- **V<sub>OVCH</sub>** = 4.05 V
- **R\_MPP[2:0]** = LHL (60%)
- **T\_MPP[1:0]** = LH (5.19 ms / 280 ms)
- **C<sub>STO</sub>** = 10 mF
- **SRC**: 5 mA current source with 3 V voltage compliance
- **EN\_HP** = H (high power mode)
- **EN\_STO\_CH** = H (storage element charge enabled)

## 11.2. Supply state

Figure 11: Supply state

- $STO\_CFG[3:0] = LLLL$
- $V_{OVDIS} = 3.00\text{ V}$
- $V_{CHRDY} = 3.50\text{ V}$
- $V_{OVCH} = 4.05\text{ V}$
- $R\_MPP[2:0] = LHL (60\%)$
- $T\_MPP[1:0] = LH (5.19\text{ ms} / 280\text{ ms})$
- $C_{STO} = 10\text{ mF}$
- SRC: 5 mA current source with 3 V voltage compliance
- EN\_HP = H (high power mode)
- EN\_STO\_CH = H (storage element charge enabled)
- 1 kΩ between STO and GND, connected between 7 s and 25.5 s (no load on STO the rest of the time)

### 11.3. Supply state and Reset state

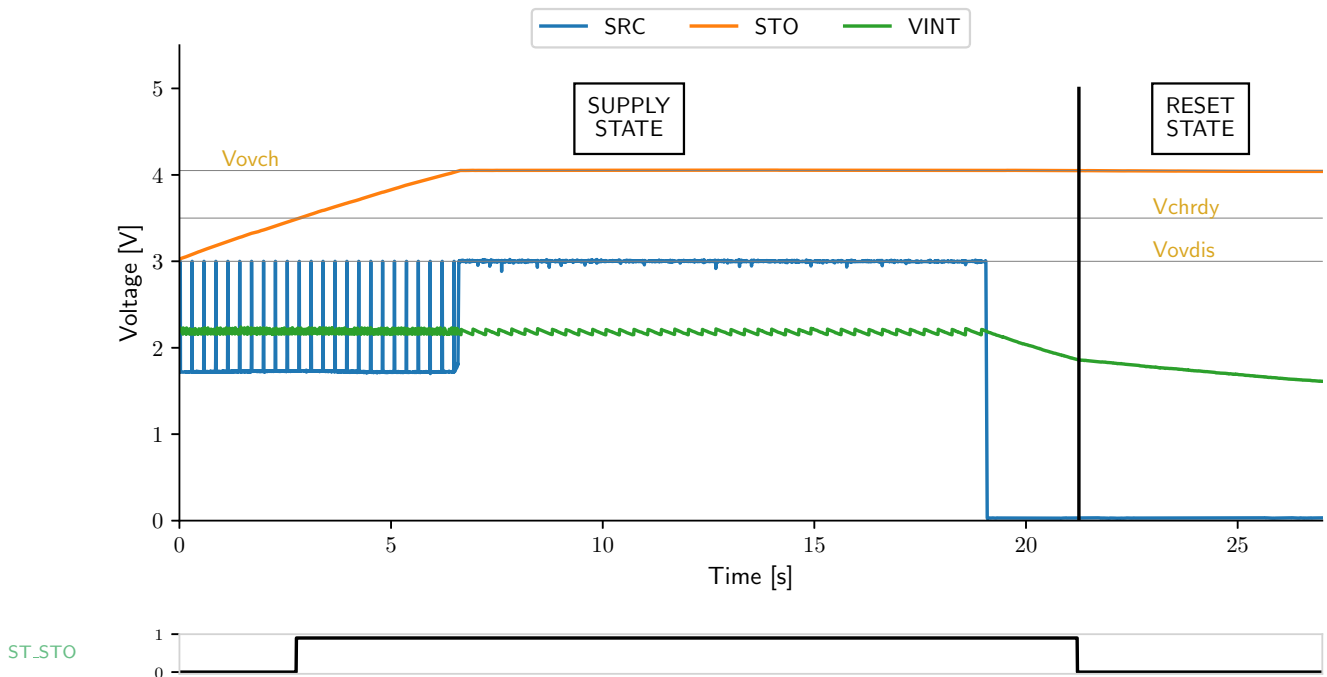

Figure 12: Supply state and Reset state

- **STO\_CFG[3:0]** = LLLL
- **V<sub>OVDIS</sub>** = 3.00 V
- **V<sub>CHRDY</sub>** = 3.50 V
- **V<sub>OVCH</sub>** = 4.05 V
- **R\_MPP[2:0]** = LHL (60%)
- **T\_MPP[1:0]** = LH (5.19 ms / 280 ms)
- **C<sub>STO</sub>** = 10 mF
- **SRC**: 5 mA current source with 3 V voltage compliance (stopped after 19 seconds)
- **EN\_HP** = H (high power mode)
- **EN\_STO\_CH** = H (storage element charge enabled)

## 12. Performance Data

### 12.1. DCDC Conversion Efficiency From SRC to STO in Low Power Mode

## 14. Layout

### 14.1. Guidelines

Good layout practices are mandatory in order to obtain good stability and best efficiency with the AEM30300. It also allows for minimizing electromagnetic interferences generated by the AEM30300 DCDC converter.

The following list, while not exhaustive, shows the main attention points when routing a PCB with the AEM30300:

- The switching nodes (**LIN** and **LOUT**) must be kept as short as possible, with minimal track resistance and minimal track capacitance. Low resistance is obtained by keeping track length as short as possible and track width as large as possible between **L<sub>DCDC</sub>** and the AEM30300 pins. Minimal capacitance is obtained by keeping distance between **LIN/LOUT** and other signals. We recommend removing the ground plane, the power plane and the bottom layer ground pour under **L<sub>DCDC</sub>** footprint, as well as adding distance between **LIN/LOUT** and the top ground pour, as shown on Figure 16.
- The DCDC decoupling capacitors (**C<sub>SRC</sub>** - **C<sub>STO</sub>**) must be placed as close as possible to the AEM30300, with direct connection and minimum track resistance for the corresponding power nodes (**BUFSRC** and **STO**).
- The **GND** return path between the DCDC decoupling capacitors (**C<sub>SRC</sub>** - **C<sub>STO</sub>**) and the AEM30300 thermal pad, which is the AEM30300 main **GND** connection, must be as direct and short as possible. This is preferably done on the top layer when possible, otherwise by internal/bottom plane, using low resistance vias to decrease layer-to-layer connection resistance.
- The external DC power connections (**SRC** and **STO**) must be connected to the AEM30300 with low resistance tracks.
- Connection between **VINT** and **C<sub>INT</sub>** must be moderately short for AEM30300 stability, even though this pins does not carry large currents. Same for connection between **C<sub>INT</sub>** to **GND**.
- If used, **ZMPP** must be connected to the AEM30300 with a low resistance track, according to the expected **SRC** power.
- The **BAL** pin connection track must be able to handle at least 40 mA.
- The custom mode setting pins **STO\_OVDIS**, **STO\_RDY** and **STO\_OVCH** are high impedance analog inputs typically connected to a resistive divider with high resistor values, making those three nodes prone to pickup noise. Thus it is recommended to keep those as short as possible and as far as possible to noise sources such as DCDC switching nodes.
- The configuration pins and the status pins have minimal layout restrictions. **CS\_IN** maximum current is below 1 mA, so its layout restrictions are minimal as well.
